

TECHNIQUE

NAMING CONVENTION

WHAT IS NAMING CONVENTION ?

- ▶ **Rules for naming** variable, function, class or other entity in source code

PURPOSE

- ▶ To reduce the effort needed to read and understand source code
- ▶ To enable code reviews to focus on more important issues

NAMING CONVENTION

COMMON RULES

CAMEL CASE

- ▶ Start with lowercase
- ▶ Multiple word start with uppercase
- ▶ Ex. productList, renderFooter, getUserById
- ▶ Common used for **variables, functions**

PASCAL CASE

- ▶ Same as camelCase but first character start with uppercase
- ▶ Ex. ProductList, RenderFooter, GetUserById
- ▶ Common used for **classname**

SNAKE CASE

- ▶ Use **only lowercase**
- ▶ Separate word with **underscore**
- ▶ Ex. resume_code, user_id
- ▶ Common used for **variables**

KEBAB CASE

- ▶ Use **only lowercase**
- ▶ Separate word with **hyphen**
- ▶ Ex. login-button, btn-danger
- ▶ Common used for **id, css name**
- ▶ *** Cannot use in javascript**

ALL UPPER CASE

- ▶ Use **only uppercase**
- ▶ Separate word with **underscore**
- ▶ Ex. API_ENDPOINT, REQUEST_TIMEOUT
- ▶ Common used for **application global variable, constant**

NAMING CONVENTION

RESERVED WORDS

RESERVED WORDS

- ▶ a word that **cannot be used** as identifier
- ▶ In Javascript such as const, let, class, export, etc...

NAMING CONVENTION

EXAMPLE

NAMING CONVENTION

FOLDER & FILE

FOLDER

- ▶ Common used in lowercase
- ▶ Multiple word use snake_case
- ▶ But mostly named in one word

FILE

- ▶ Common used in lowercase
- ▶ If has more than two word use snake_case
- ▶ * In Javascript sometime use exported entity convention such as export class so use class convention

NAMING CONVENTION

CLASS NAME

CLASS NAME

- ▶ Common used in **PascalCase**
- ▶ Should be a **noun**
- ▶ Ex. ProductList, About

NAMING CONVENTION

FUNCTION NAME

FUNCTION NAME

- ▶ Common used in camelCase
- ▶ Should be a verb
- ▶ Ex. renderDatePicker, createUser, getActiveMenu
- ▶ * In React functional component use convention same as class name convention

CLASS & FUNCTION COMBINATION

- ▶ Class should be a noun and function should be a verb makes more readability
- ▶ Ex. `product.remove()`, `image.resizeTo()`

NAMING CONVENTION

VARIABLE

COMMON VARIABLE

- ▶ Common use in **camelCase** and **snake_case**
- ▶ Should be a **noun**
- ▶ * If variable name is verb try to write in function call

CONSTANT VARIABLE

- ▶ Common used in **all uppercase with underscore**
- ▶ Ex. REQUEST_TIMEOUT, API_ENDPOINT

NAMING CONVENTION

BOOLEAN

BOOLEAN

- ▶ true/false
- ▶ Start with **is**, **has**, **can**
- ▶ Ex. isActive, hasPhoneNumber

NAMING CONVENTION

CSS CONVENTION

COMMON CSS CONVENTION

- ▶ All **lowercase** with **hyphen** (-)
- ▶ Ex. product-item, icon-github

CSS STYLE GUIDE

- ▶ BEM - getbem.com
- ▶ RSCSS - rscss.io

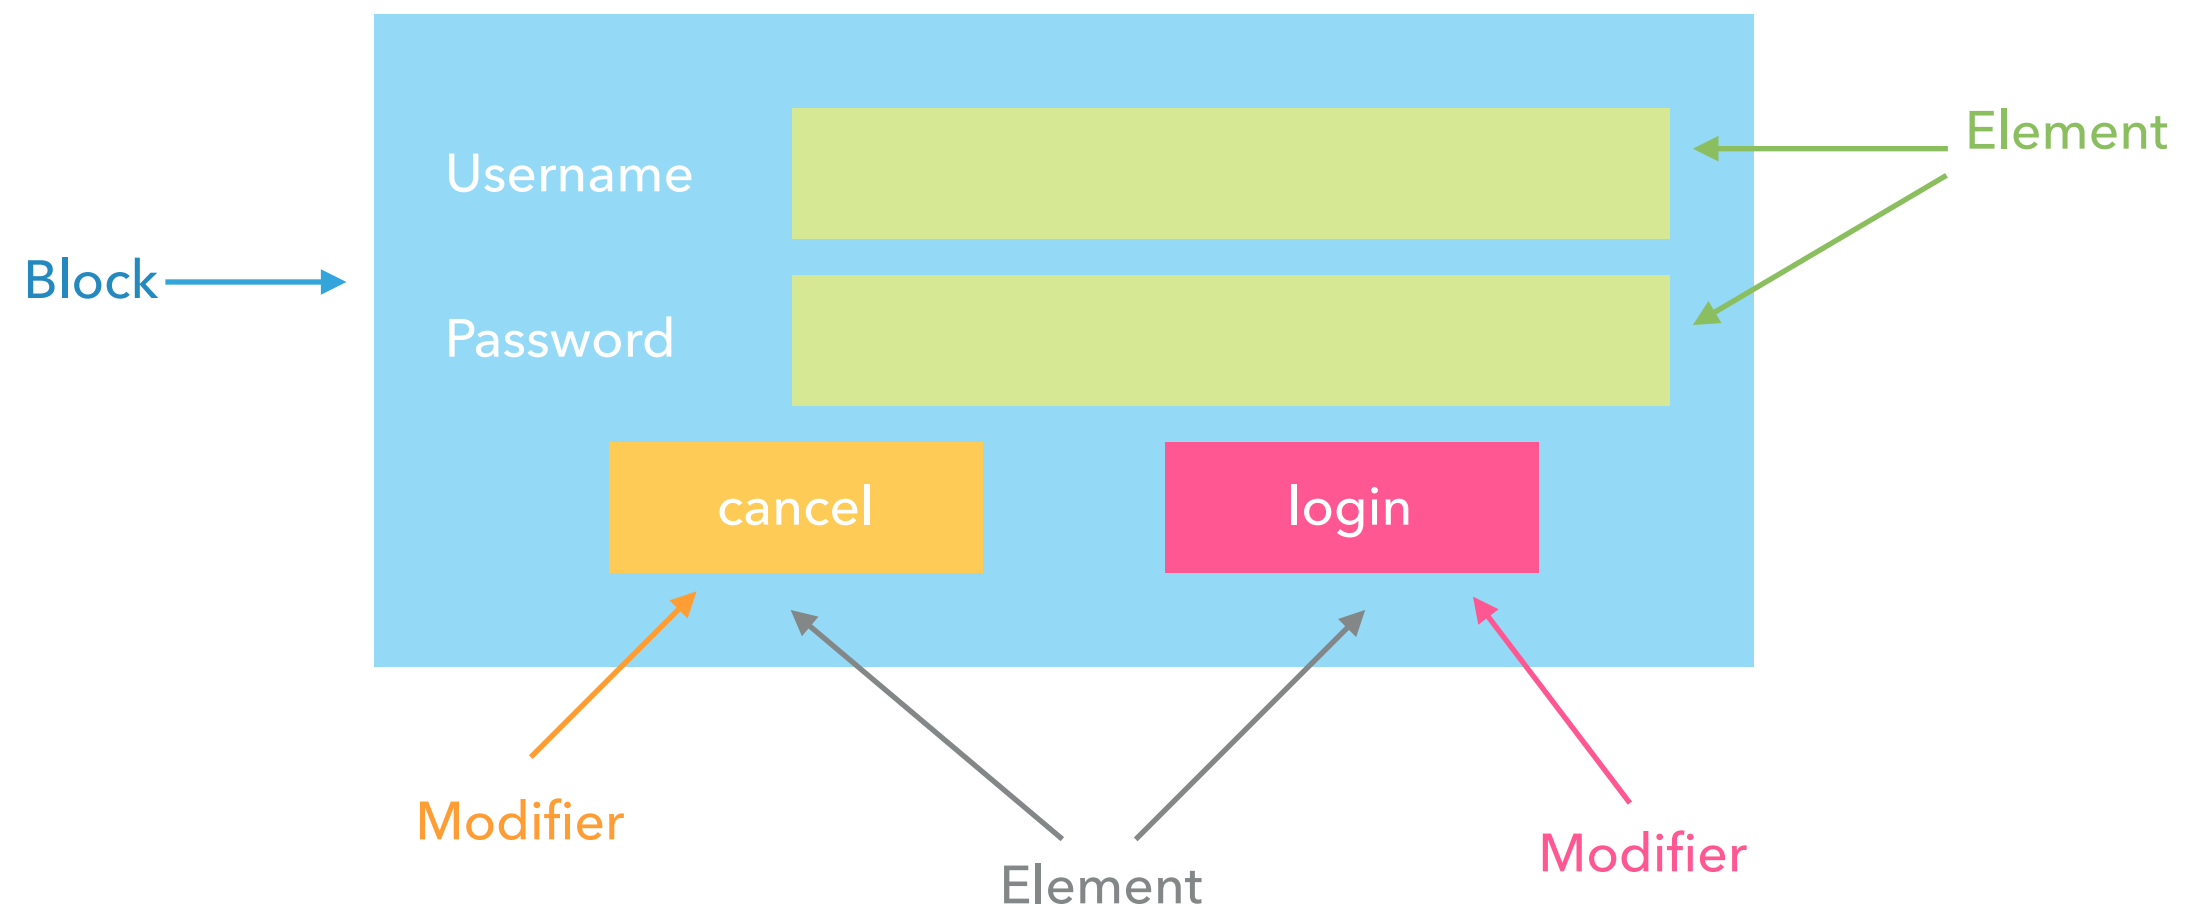

BEM

- ▶ **Block** - Standalone entity that is **meaningful on its own**
- ▶ **Element** - **Parts** of a block and have no standalone meaning
- ▶ **Modifier** - Use them to change **appearance, behavior** or **state**

BEM

- ▶ **Block** - Contain letter and can have dash
- ▶ **Element** - Begin with two underscore
- ▶ **Modifier** - Begin with two hyphen

BEM

BEM

Concept

```
.block {  
  ...  
}
```

```
.block__element {  
  ...  
}
```

```
.block__element--modifier {  
  ...  
}
```

Example

```
.loginbox {  
  ...  
}
```

```
.loginbox__button {  
  ...  
}
```

```
.loginbox__button--red {  
  ...  
}
```

RSCSS

- ▶ **Component** - Standalone entity that is **meaningful on its own**
- ▶ **Element** - **Parts** of a block and have no standalone meaning
- ▶ **Variant** - Use them to change **appearance, behavior** or **state**
- ▶ **Helper** - **Override all style**

RSCSS

- ▶ **Component** - Named **at least two words** with **hyphen** each **word**
- ▶ **Element** - Only **one word**
- ▶ **Variant** - Only **one word** and **begin with underscore**
- ▶ **Helper** - Only **one word** and **begin with hyphen**

RSCSS

RSCSS

Concept

```
.component-box {  
  ...  
}
```

```
.component-box element {  
  ...  
}
```

```
.component-box element -modifier {  
  ...  
}
```

```
.component-box _helper {  
  ...  
}
```

Example

```
.login-box {  
  ...  
}
```

```
.login-box button {  
  ...  
}
```

```
.login-box button -red {  
  ...  
}
```

```
.login-box _nomargin {  
  ...  
}
```

NAMING CONVENTION

NAMING TECHNIQUE

CREATE CLEAR NAMING

- ▶ Specify what variable is or function do
- ▶ Ex. `checkApply()` to `canApply()`

COMMON LETTER VARIABLE

- ▶ `i, j, k` is valid for index counter
- ▶ `e` is valid for Javascript event Ex. `e.target.value`
- ▶ `e` is valid for JAVA exception Ex. `catch(exception e)`

DUPLICATE NAME IN FOLDER DIRECTORY

- ▶ `actions/productAction.js` to `actions/product.js`
- ▶ `containers/ProductContainer.js` to `containers/Product.js`

SINGLE AND PLURAL

- ▶ Ex. **product** should contain **one product**
- ▶ Ex. **products** should contain **array of product**
- ▶ Ex. **getProducts()** should not return a object

NAMING WITHOUT ABBREVIATION

- ▶ Ex. **prod** should be **product** because it can be **product**, **production**, **produce**
- ▶ Ex. **msg** should be **message**

LANGUAGE SPECIFIC CONVENTION

- ▶ Use **language specific convention** to define identity
- ▶ Ex. Javascript use camelCase
- ▶ Ex. C++ use snake_case

GAINS MORE WORD

- ▶ Code review
- ▶ Read other code or blog
